Time Series Analysis and Control Program Package

# Description

R functions for statistical analysis and control of time series.

# **Details**

This package provides functions for statistical analysis, prediction and control of time series. For a complete list of functions, use library(help="timsac").

For overview of models and information criteria for model selection, see ../doc/timsac-guide\_e.pdf or ../doc/timsac-guide\_j.pdf (in Japanese). PDF version of reference manual is available in ../doc/timsac-manual.pdf

Airpollution

Airpollution Data

### **Description**

An airpollution data for testing perars.

#### Usage

data(Airpollution)

#### **Format**

A time series of 372 observations.

#### Source

H.Akaike, G.Kitagawa, E.Arahata and F.Tada (1979) *Computer Science Monograph, No.11, Tim-sac78*. The Institute of Statistical Mathematics.

Amerikamaru

Amerikamaru Data

### **Description**

A multivariate non-stationary data for testing blomar.

#### Usage

data(Amerikamaru)

#### **Format**

A 2-dimensional array with 896 observations on 2 variables.

4 armafit

- [,1] rudder
- [,2] yawing

# Source

H.Akaike, G.Kitagawa, E.Arahata and F.Tada (1979) *Computer Science Monograph*, *No.11*, *Timsac78*. The Institute of Statistical Mathematics.

armafit

ARMA Model Fitting

# Description

Fit an ARMA model with specified order by using DAVIDON's algorithm.

# Usage

```
armafit(y, model.order)
```

# Arguments

y a univariate time series.

model.order a numerical vector of the form c(ar, ma) which gives the order to be fitted suc-

cessively.

### **Details**

The maximum likelihood estimates of the coefficients of a scalar ARMA model

$$y(t) - a(1)y(t-1) - \dots - a(p)y(t-p) = u(t) - b(1)u(t-1) - \dots - b(q)u(t-q)$$

of a time series y(t) are obtained by using DAVIDON's algorithm. Pure autoregression is not allowed.

# Value

arcoet	maximum likelihood estimates of AR coefficients.
macoef	maximum likelihood estimates of MA coefficients.
arstd	standard deviation (AR).
mastd	standard deviation (MA).
V	innovation variance.
aic	AIC.
grad	final gradient.

auspec 5

#### References

H.Akaike, E.Arahata and T.Ozaki (1975) *Computer Science Monograph, No.5, Timsac74, A Time Series Analysis and Control Program Package (1)*. The Institute of Statistical Mathematics.

### **Examples**

```
# "arima.sim" is a function in "stats". # Note that the sign of MA coefficient is opposite from that in "timsac". y <- arima.sim(list(order=c(2,0,1), ar = c(0.64,-0.8), ma=-0.5), 1000) z <- armafit(y, model.order=c(2,1)) z\alpha
```

auspec

Power Spectrum

# **Description**

Compute power spectrum estimates for two trigonometric windows of Blackman-Tukey type by Goertzel method.

# Usage

```
auspec(y, lag=NULL, window="Akaike", log=FALSE, plot=TRUE)
```

# **Arguments**

y a univariate time series.

lag maximum lag. Default is  $2\sqrt{n}$ , where n is the length of time series y.

window character string giving the definition of smoothing window. Allowed values are "Akaike" (default) or "Hanning".

log logical. If TRUE, the spectrum spec is plotted as log(spec).

plot logical. If TRUE (default) the spectrum spec is plotted.

#### Details

```
Hanning Window: a1(0)=0.5, a1(1)=a1(-1)=0.25, a1(2)=a1(-2)=0
Akaike Window: a2(0)=0.625, a2(1)=a2(-1)=0.25, a2(2)=a2(-2)=-0.0625
```

#### Value

spec spectrum smoothing by window stat test statistics.

6 autcor

#### References

H.Akaike and T.Nakagawa (1988) Statistical Analysis and Control of Dynamic Systems. Kluwer Academic publishers.

#### **Examples**

```
y <- arima.sim(list(order=c(2,0,0), ar=c(0.64,-0.8)), n=200) auspec(y, log=TRUE)
```

autcor

Autocorrelation

#### **Description**

Estimate autocovariances and autocorrelations.

#### Usage

```
autcor(y, lag=NULL, plot=TRUE, lag_axis=TRUE)
```

#### **Arguments**

y a univariate time series.

lag maximum lag. Default is  $2\sqrt{n}$ , where n is the length of the time series y.

plot logical. If TRUE (default) autocorrelations are plotted.

lag\_axis logical. If TRUE (default) with plot=TRUE, x-axis is drawn.

# Value

acov autocovariances.

acor autocorrelations (normalized covariances).

mean of y.

#### References

H.Akaike and T.Nakagawa (1988) *Statistical Analysis and Control of Dynamic Systems*. Kluwer Academic publishers.

# **Examples**

```
# Example 1 for the normal distribution
y <- rnorm(200)
autcor(y, lag_axis=FALSE)

# Example 2 for the ARIMA model
y <- arima.sim(list(order=c(2,0,0), ar=c(0.64,-0.8)), n=200)
autcor(y, lag=20)</pre>
```

autoarmafit 7

autoarmafit

Automatic ARMA Model Fitting

### Description

Provide an automatic ARMA model fitting procedure. Models with various orders are fitted and the best choice is determined with the aid of the statistics AIC.

### Usage

```
autoarmafit(y, max.order=NULL)
```

### Arguments

y a univariate time series.

max.order upper limit of AR order and MA order. Default is  $2\sqrt{n}$ , where n is the length of

the time series y.

#### **Details**

The maximum likelihood estimates of the coefficients of a scalar ARMA model

$$y(t) - a(1)y(t-1) - \ldots - a(p)y(t-p) = u(t) - b(1)u(t-1) - \ldots - b(q)u(t-q)$$

of a time series y(t) are obtained by using DAVIDON's variance algorithm. Where p is AR order, q is MA order and u(t) is a zero mean white noise. Pure autoregression is not allowed.

#### Value

best.model the best choice of ARMA coefficients.

model a list with components arcoef (Maximum likelihood estimates of AR coef-

ficients), macoef (Maximum likelihood estimates of MA coefficients), arstd (AR standard deviation), mastd (MA standard deviation), v (Innovation variance), aic (AIC =  $n\log(det(v)) + 2(p+q)$ ) and grad (Final gradient) in AIC

increasing order.

#### References

H.Akaike, E.Arahata and T.Ozaki (1975) *Computer Science Monograph, No.5, Timsac74, A Time Series Analysis and Control Program Package (1).* The Institute of Statistical Mathematics.

# **Examples**

```
# "arima.sim" is a function in "stats".

# Note that the sign of MA coefficient is opposite from that in "timsac".

y <- arima.sim(list(order=c(2,0,1),ar=c(0.64,-0.8),ma=-0.5),n=1000)

autoarmafit(y)
```

8 baysea

baysea	Bayesian Seasonal Adjustment Procedure

# **Description**

Decompose a nonstationary time series into several possible components.

# Usage

```
baysea(y, period=12, span=4, shift=1, forecast=0, trend.order=2,
       seasonal.order=1, year=0, month=1, out=0, rigid=1,
       zersum=1, delta=7, alpha=0.01, beta=0.01, gamma=0.1,
       spec=TRUE, plot=TRUE, separate.graphics=FALSE)
```

### **Arguments**

a univariate time series. У period number of seasonals within a period. number of periods to be processed at one time. span shift number of periods to be shifted to define the new span of data. forecast length of forecast at the end of data. trend.order order of differencing of trend. seasonal.order order of differencing of seasonal. seasonal.order is smaller than or equal to span. trading-day adjustment option. year = 0: without trading-day adjustment with trading-day adjustment (the series is supposed to start at this year) number of the month in which the series starts. If year=0 this parameter is month ignored. out outlier correction option.

without outlier detection

1: with outlier detection by marginal probability with outlier detection by model selection

rigid controls the rigidity of the seasonal component. more rigid seasonal with larger

than rigid.

zersum controls the sum of the seasonals within a period.

delta controls the leap year effect.

alpha controls prior variance of initial trend.

9 baysea

controls prior variance of initial seasonal. beta

controls prior variance of initial sum of seasonal. gamma

logical. If TRUE (default) estimate spectra of irregular and differenced adjusted. spec plot logical. If TRUE (default) plot trend, adjust, smoothed, season and irregular.

separate.graphics

logical. If TRUE a graphic device is opened for each graphics display.

#### **Details**

This function realized a decomposition of time series y into the form

$$y(t) = T(t) + S(t) + I(t) + TDC(t) + OCF(t)$$

where T(t) is trend component, S(t) is seasonal component, I(t) is irregular, TDC(t) is trading day factor and OCF(t) is outlier correction factor. For the purpose of comparison of models the criterion ABIC is defined

 $ABIC = -2\log(maximum\ likelihood\ of\ the\ model).$ 

Smaller value of ABIC represents better fit.

#### Value

outlier correction factor. outlier

trend. trend season seasonal.

tday trading-day component if year > 0. irregular = y-trend-season-tday-outlier.

adjust = trend-irregular. smoothed = trend+season+tday.

aveABIC averaged ABIC.

irregular.spec a list with components acov (autocovariances), acor (normalized covariances),

mean, v (innovation variance), aic (AIC), parcor (partial autocorrelation) and

rspec (rational spectrum) of irregular if spec=TRUE.

a list with components acov, acor, mean, v, aic, parcor and rspec of differadjusted.spec

enced adjusted series if spec=TRUE.

differenced.trend

a list with components acov, acor, mean, v, aic and parcor of differenced trend series if spec=TRUE.

differenced.season

a list with components acov, acor, mean, v, aic and parcor of differenced seasonal series if spec=TRUE.

10 bispec

### **Examples**

```
data(LaborData)
baysea(LaborData, forecast=12)
```

bispec Bispectrum

# **Description**

Compute bi-spectrum using the direct Fourier transform of sample third order moments.

#### Usage

```
bispec(y, lag=NULL, window="Akaike", log=FALSE, plot=TRUE)
```

# Arguments

y a univariate time series.

lag maximum lag. Default is  $2\sqrt{n}$ , where n is the length of the time series y.

window character string giving the definition of smoothing window. Allowed values are

"Akaike" (default) or "Hanning".

logical. If TRUE the spectrum pspec is plotted as log(pspec).

plot logical. If TRUE (default) the spectrum pspec is plotted.

#### **Details**

Hanning Window: a1(0)=0.5, a1(1)=a1(-1)=0.25, a1(2)=a1(-2)=0Akaike Window: a2(0)=0.625, a2(1)=a2(-1)=0.25, a2(2)=a2(-2)=-0.0625

### Value

pspec power spectrum smoothed by window.

sig significance. cohe coherence.

breal real part of bispectrum.

bimag imaginary part of bispectrum.

exval approximate expected value of coherence under Gaussian assumption.

blocar

Bayesian Method of Locally Stationary AR Model Fitting; Scalar Case

# **Description**

Locally fit autoregressive models to non-stationary time series by a Bayesian procedure.

# Usage

```
blocar(y, max.order=NULL, span, plot=TRUE)
```

### **Arguments**

y a univariate time series.

max.order upper limit of the order of AR model. Default is  $2\sqrt{n}$ , where n is the length of

the time series y.

span length of basic local span.

plot logical. If TRUE (default) spectrums pspec are plotted.

12 blocar

#### **Details**

The basic AR model of scalar time series y(t)(t = 1, ..., n) is given by

$$y(t) = a(1)y(t-1) + a(2)y(t-2) + \dots + a(p)y(t-p) + u(t),$$

where p is order of the model and u(t) is Gaussian white noise with mean 0 and variance v. At each stage of modeling of locally AR model, a two-step Bayesian procedure is applied

- 1. Averaging of the models with different orders fitted to the newly obtained data.
- 2. Averaging of the models fitted to the present and preceding spans.

AIC of the model fitted to the new span is defined by

$$AIC = ns \log(sd) + 2k$$
,

where ns is the length of new data, sd is innovation variance and k is the equivalent number of parameters, defined as the sum of squares of the Bayesian weights. AIC of the model fitted to the preceding spans are defined by

$$AIC(j+1) = ns\log(sd(j)) + 2,$$

where sd(j) is the prediction error variance by the model fitted to j periods former span.

#### Value

var	variance.
aic	AIC.
bweight	Bayesian weight.
pacoef	partial autocorrelation.
arcoef	coefficients ( average by the Bayesian weights ).
V	innovation variance.
init	initial point of the data fitted to the current model.
end	end point of the data fitted to the current model.
pspec	power spectrum.

z <- blocar(locarData, max.order=10, span=300)
z$arcoef</pre>
```

blomar 13

blomar

Bayesian Method of Locally Stationary Multivariate AR Model Fitting

### **Description**

Locally fit multivariate autoregressive models to non-stationary time series by a Bayesian procedure.

# Usage

blomar(y, max.order=NULL, span)

# Arguments

y A multivariate time series.

max.order upper limit of the order of AR model, less than or equal to n/(2\*d) where n is

the length and d is the dimension of the time series y. Default is  $min(2\sqrt{n}, n/(2*$ 

d)).

span length of basic local span. If n-max.order-1 is less than or equal to span or

n-max.order-1-span is less than 2\*max.order\*d, span is n-max.order.

#### **Details**

The basic AR model is given by

$$y(t) = A(1)y(t-1) + A(2)y(t-2) + \ldots + A(p)y(t-p) + u(t),$$

where p is order of the AR model and u(t) is innovation variance v.

### Value

mean mean.
var variance.

bweight Bayesian weight.

aic AIC with respect to the present data.

arcoef AR coefficients. arcoef[[m]][i,j,k] shows the value of i-th row, j-th col-

umn, k-th order of m-th model.

v innovation variance.

eaic equivalent AIC of Bayesian model.

init start point of the data fitted to the current model.
end end point of the data fitted to the current model.

14 bsubst

# **Examples**

```
data(Amerikamaru)
blomar(Amerikamaru, max.order=10, span=300)
```

Blsallfood

Blsallfood data

#### **Description**

A blsallfood data for testing decomp.

# Usage

data(Blsallfood)

#### **Format**

A time series of 156 observations.

### **Source**

H.Akaike, T.Ozaki, M.Ishiguro, Y.Ogata, G.Kitagawa, Y-H.Tamura, E.Arahata, K.Katsura and Y.Tamura (1984) *Computer Science Monographs, Timsac-84 Part 1*. The Institute of Statistical Mathematics.

bsubst

Bayesian Type All Subset Analysis

# **Description**

Produce Bayesian estimates of time series models such as pure AR models, AR models with non-linear terms, AR models with polynomial type mean value functions, etc. The goodness of fit of a model is checked by the analysis of several steps ahead prediction errors.

bsubst 15

### Usage

#### **Arguments**

y a univariate time series.

mtype model type. Allowed values are

1: autoregressive model,

2: polynomial type non-linear model (lag's read in),

3: polynomial type non-linear model (lag's automatically set),

4: AR-model with polynomial mean value function,

5,6,7: originally defined but omitted here.

lag maximum time lag. Default is  $2\sqrt(n)$ , where n is the length of the time series

у.

nreg number of regressors.

reg specification of regressor (mtype = 2).

i-th regressor is defined by  $z(n-L1(i))\times z(n-L2(i))\times z(n-L3(i))$ , where L1(i) is reg(1,i), L2(i) is reg(2,i) and L3(i) is reg(3,i). 0-lag term z(n-1) is replaced by the constant 1.

0) is replaced by the constant 1.

term.lag maximum time lag specify the regressors (L1(i), L2(i), L3(i)) (i=1,...,nreg)

(mtype = 3).

term.lag(1): maximum time lag of linear term term.lag(2): maximum time lag of squared term

term.lag(3): maximum time lag of quadratic crosses term

term.lag(4): maximum time lag of cubic term

term.lag(5): maximum time lag of cubic cross term.

cstep prediction errors checking (up to cstep-steps ahead) is requested. (mtype =

1,2,3).

plot logical. If TRUE (default) daic, perr and peautcor are plotted.

# Details

The AR model is given by (mtype = 2)

$$y(t) = a(1)y(t-1) + \dots + a(p)y(t-p) + u(t).$$

The non-linear model is given by ( mtype = 2,3 )

$$y(t) = a(1)z(t,1) + a(2)z(t,2) + ... + a(p)z(t,p) + u(t).$$

Where p is AR order and u(t) is Gaussian white noise with mean 0 and variance v(p).

16 bsubst

#### Value

ymean mean of y.
yvar variance of y.

v innovation variance.

aic AIC(m), (m=0,...,nreg).

aicmin minimum AIC.

daic AIC(m)-aicmin (m=0,...,nreg).

order.maice order of minimum AIC.

v.maice innovation variance attained at order.maice.

arcoef.maice AR coefficients attained at order.maice.

v.bay residual variance of Bayesian model.

aic.bay AIC of Bayesian model.

np.bay equivalent number of parameters.

arcoef.bay AR coefficients of Bayesian model.

ind.c index of parcor2 in order of increasing magnitude.

parcor2 square of partial correlations (normalized by multiplying N).

damp binomial type damper.

bweight final Bayesian weights of partial correlations.

parcor.bay partial correlations of the Bayesian model.

eicmin minimum EIC.

esum whole subset regression models.

npmean mean of number of parameter.

npmean.nreg =npmean/nreg.
perr prediction error.

mean mean.
var variance.
skew skewness.
peak peakedness.

peautcor autocorrelation function of 1-step ahead prediction error.

pspec power spectrum (mtype = 1).

#### References

canarm

Canonical Correlation Analysis of Scalar Time Series

# Description

Fit an ARMA model to stationary scalar time series through the analysis of canonical correlations between the future and past sets of observations.

# Usage

```
canarm(y, lag=NULL, max.order=NULL, plot=TRUE)
```

18 canarm

### **Arguments**

y a univariate time series.

lag maximum lag. Default is  $2\sqrt{n}$ , where n is the length of the time series y.

max.order upper limit of AR order and MA order, must be less than or equal to lag. Default

is lag.

plot logical. If TRUE (default) parcor is plotted.

#### **Details**

The ARMA model of stationary scalar time series y(t)(t = 1, ..., n) is given by

$$y(t) - a(1)y(t-1) - \dots - a(p)y(t-p) = u(t) - b(1)u(t-1) - \dots - b(q)u(t-q),$$

where p is AR order and q is MA order.

#### Value

arinit AR coefficients of initial AR model fitting by the minimum AIC procedure.

v innovation vector.

aic AIC.

aicmin minimum AIC.

order.maice order of minimum AIC.

parcor partial autocorrelation.

nc total number of case.

future number of present and future variables.

past number of present and past variables.

cweight future set canonical weight.

canocoef canonical R.
canocoef2 R-squared.
chisquar chi-square.
ndf N.D.F.
dic DIC.

dicmin minimum DIC.

order.dicmin order of minimum DIC.

arcoef  $\mbox{AR coefficients } a(i) (i=1,...,p). \\ \mbox{macoef} \mbox{MA coefficients } b(i) (i=1,...,q). \\ \label{eq:macoef}$

canoca

Canonical Correlation Analysis of Vector Time Series

#### **Description**

Analyze canonical correlation of a d-dimensional multivariate time series.

# Usage

canoca(y)

#### **Arguments**

у

a multivariate time series.

#### Details

First AR model is fitted by the minimum AIC procedure. The results are used to ortho-normalize the present and past variables. The present and future variables are tested successively to decide on the dependence of their predictors. When the last DIC (=chi-square - 2.0\*N.D.F.) is negative the predictor of the variable is decided to be linearly dependent on the antecedents.

#### Value

aic AIC.

aicmin minimum AIC.

order.maice MAICE AR model order.
v innovation variance.

arcoef autoregressive coefficients. arcoef[i,j,k] shows the value of i-th row, j-th

column, k-th order.

nc number of cases.

future number of variable in the future set.
past number of variables in the past set.

cweight future set canonical weight.

 $\begin{array}{ll} \text{canocoef} & \text{canonical } R. \\ \text{canocoef2} & R\text{-squared.} \end{array}$ 

20 covgen

chi squar chi square.

ndf N.D.F.

dic DIC.

dicmin minimum DIC.

order.dicmin order of minimum DIC. matF the transition matrix F.

vectH structural characteristic vector H of the canonical Markovian representation.

matG the estimate of the input matrix G.

vectF matrix F in vector form.

### **Examples**

covgen

Covariance Generation

# Description

Produce the Fourier transform of a power gain function in the form of an autocovariance sequence.

# Usage

```
covgen(lag, f, gain, plot=TRUE)
```

#### **Arguments**

lag	desired maximum lag of covariance.
f	frequency $f(i)$ $(i = 1,, k)$ , where $k$ is the number of data points. By definition $f(1) = 0.0$ and $f(k) = 0.5$ , $f(i)$ 's are arranged in increasing order.
gain	power gain of the filter at the frequency f(i).
plot	logical. If TRUE (default) autocorrelations are plotted.

decomp 21

#### Value

acov autocovariance.

acor autocovariance normalized.

#### References

H.Akaike, E.Arahata and T.Ozaki (1975) *Computer Science Monograph, No.5, Timsac74, A Time Series Analysis and Control Program Package (1)*. The Institute of Statistical Mathematics.

### **Examples**

```
spec <- raspec(h=100, var=1, arcoef=c(0.64,-0.8), plot=FALSE) covgen(lag=100, f=0:100/200, gain=spec)
```

decomp

Time Series Decomposition (Seasonal Adjustment) by Square-Root Filter

### **Description**

Decompose a nonstationary time series into several possible components by square-root filter.

#### Usage

# Arguments

y a univariate time series. trend.order trend order (0, 1, 2 or 3).

ar.order AR order (less than 11, try 2 first). frequency number of seasons in one period.

seasonal.order seasonal order (0, 1 or 2).

log log transformation of data (if log = TRUE).
trade trading day adjustment (if trade = TRUE).
diff numerical differencing (1 sided or 2 sided).

year the first year of the data.
month the first month of the data.

miss missing data flag.

= 0: no consideration

> 0: values which are greater than omax are treated as missing data < 0: values which are less than omax are treated as missing data

22 decomp

omax maximum or minimum data value (if miss > 0 or miss < 0).

plot logical. If TRUE (default) trend, seasonal, ar and trad are plotted.

#### **Details**

```
The Basic Model
```

```
y(t) = T(t) + AR(t) + S(t) + TD(t) + W(t)
```

where T(t) is trend component, AR(t) is AR process, S(t) is seasonal component, TD(t) is trading day factor and W(t) is observational noise.

### Component Models

Trend component (trend.order m1)

```
\begin{array}{l} m1 = 1: T(t) = T(t-1) + V1(t) \\ m1 = 2: T(t) = 2T(t-1) - T(t-2) + V1(t) \\ m1 = 3: T(t) = 3T(t-1) - 3T(t-2) + T(t-2) + V1(t) \end{array}
```

# AR component (ar.order m2)

$$AR(t) = a(1)AR(t-1) + \dots + a(m2)AR(t-m2) + V2(t)$$

Seasonal component (seasonal order k, frequency f)

$$k = 1: S(t) = -S(t-1) - \dots - S(t-f+1) + V3(t)$$
  

$$k = 2: S(t) = -2S(t-1) - \dots - f S(t-f+1) - \dots - S(t-2f+2) + V3(t)$$

# Trading day effect

```
TD(t) = b(1)TRADE(t, 1) + \ldots + b(7)TRADE(t, 7)
```

where TRADE(t, i) is the number of *i*-th days of the week in *t*-th data and b(1) + ... + b(7) = 0.

### Value

trend	trend component.
seasonal	seasonal component.
ar	AR process.
trad	trading day factor.
noise	observational noise.
aic	AIC.
lkhd	likelihood.
sigma2	sigma^2.
4 1	

tau1 system noise variances tau2(1).
tau2 system noise variances tau2(2).
tau3 system noise variances tau2(3).
arcoef vector of AR coefficients.

tdf trading day factor tdf(i) (i=1,7).

fftcor

Auto And/Or Cross Correlations via FFT

#### **Description**

Compute auto and/or cross covariances and correlations via FFT.

# Usage

```
fftcor(y, lag=NULL, isw=4, plot=TRUE, lag_axis=TRUE)
```

# **Arguments**

y data of channel X and Y (data of channel Y is given for isw = 2 or 4 only).

lag maximum lag. Default is  $2\sqrt{n}$ , where n is the length of the time series y.

numerical flag giving the type of computation.

1: auto-correlation of X (one-channel)

2: auto-correlations of X and Y (two-channel)

4: auto- and cross- correlations of X and Y (two-channel)

fpeaut 25

plot	logical. If TRUE (default) cross-correlations are plotted.
lag_axis	logical. If TRUE (default) with plot=TRUE, x-axis is drawn.

# Value

acov	auto-covariance.
ccov12	cross-covariance.
ccov21	cross-covariance.
acor	auto-correlation.
ccor12	cross-correlation.
ccor21	cross-correlation.
mean	mean.

```

mfilter

Linear Filtering on a Multivariate Time Series

# Description

Applies linear filtering to a multivariate time series.

# Usage

```
mfilter(x, filter, method=c("convolution","recursive"), init)
```

#### **Arguments**

X	a multivariate ( $m$ -dimensional, $n$ length) time series $x[n, m]$ .
filter	an array of filter coefficients. filter [i,j,k] shows the value of $i$ -th row, $j$ -th column, $k$ -th order
method	either "convolution" or "recursive" (and can be abbreviated). If "convolution" a moving average is used: if "recursive" an autoregression is used. For convolution filters, the filter coefficients are for past value only.
init	specifies the initial values of the time series just prior to the start value, in reverse time order. The default is a set of zeros.

mfilter 31

#### **Details**

This is a multivariate version of "filter" function. Missing values are allowed in 'x' but not in 'filter' (where they would lead to missing values everywhere in the output). Note that there is an implied coefficient 1 at lag 0 in the recursive filter, which gives

$$y[i,]' = x[i,]' + f[i,1] \times y[i-1,]' + \dots + f[i,p] \times y[i-p,]',$$

No check is made to see if recursive filter is invertible: the output may diverge if it is not. The convolution filter is

$$y[i,]' = f[,,1] \times x[i,]' + \ldots + f[,,p] \times x[i-p+1,]'.$$

#### Value

mfilter returns a time series object.

#### Note

'convolve(, type="filter")' uses the FFT for computations and so may be faster for long filters on univariate time series (and so the time alignment is unclear), nor does it handle missing values. 'filter' is faster for a filter of length 100 on a series 1000, for examples.

mlocar

Minimum AIC Method of Locally Stationary AR Model Fitting; Scalar Case

# **Description**

Locally fit autoregressive models to non-stationary time series by minimum AIC procedure.

# Usage

```
mlocar(y, max.order=NULL, span, const=0, plot=TRUE)
```

# **Arguments**

У	a univariate time series.
max.order	upper limit of the order of AR model. Default is $2\sqrt{n}$ , where $n$ is the length of the time series y.
span	length of the basic local span.
const	integer. 0 denotes constant vector is not included as a regressor and 1 denotes constant vector is included as the first regressor.
plot	logical. If TRUE (default) spectrums pspec are plotted.

# **Details**

The data of length n are divided into k locally stationary spans,

$$|<-n_1->|<-n_2->|<-n_3->|....|<-n_k->|$$

where  $n_i$  (i = 1, ..., k) denotes the number of basic spans, each of length span, which constitute the *i*-th locally stationary span. At each local span, the process is represented by a stationary autoregressive model.

mlomar 33

#### Value

Multivariate Bayesian Method of AR Model Fitting

### Description

Determine multivariate autoregressive models by a Bayesian procedure. The basic least squares estimates of the parameters are obtained by the householder transformation.

# Usage

```
mulbar(y, max.order=NULL, plot=FALSE)
```

### **Arguments**

y a multivariate time series.

max.order upper limit of the order of AR model, less than or equal to n/(2\*d) where n is

the length and d is the dimension of the time series y. Default is  $min(2\sqrt{n}, n/(2*$ 

d)).

plot logical. If TRUE daic is plotted.

#### **Details**

The statistic AIC is defined by

$$AIC = n\log(\det(v)) + 2k,$$

where n is the number of data, v is the estimate of innovation variance matrix, det is the determinant and k is the number of free parameters.

Bayesian weight of the m-th order model is defined by

$$W(n) = const \times C(m)/(m+1),$$

where const is the normalizing constant and  $C(m) = \exp(-0.5AIC(m))$ . The Bayesian estimates of partial autoregression coefficient matrices of forward and backward models are obtained by  $(m = 1, \ldots, lag)$ 

$$G(m) = G(m)D(m),$$

36 mulbar

$$H(m) = H(m)D(m),$$

where the original G(m) and H(m) are the (conditional) maximum likelihood estimates of the highest order coefficient matrices of forward and backward AR models of order m and D(m) is defined by

$$D(m) = W(m) + \ldots + W(lag).$$

The equivalent number of parameters for the Bayesian model is defined by

$$ek = (D(1)^2 + ... + D(lag)^2)id + id(id + 1)/2$$

where id denotes dimension of the process.

#### Value

mulcor

Multiple Correlation

# **Description**

Estimate multiple correlation.

## Usage

```
mulcor(y, lag=NULL, plot=TRUE, lag_axis=TRUE)
```

## **Arguments**

y a multivariate time series.

lag maximum lag. Default is  $2\sqrt{n}$ , where n is the length of the time series y.

plot logical. If TRUE (default) correlations cor are plotted.

lag\_axis logical. If TRUE (default) with plot=TRUE, x-axis is drawn.

## Value

cov covariances.

cor correlations (normalized covariances).

mean mean.

## References

mulfrf

Frequency Response Function (Multiple Channel)

# Description

Compute multiple frequency response function, gain, phase, multiple coherency, partial coherency and relative error statistics.

# Usage

```
mulfrf(y, lag=NULL, iovar=NULL)
```

## **Arguments**

у	a multivariate time series.
lag	maximum lag. Default is $2\sqrt{n}$ , where $n$ is the number of rows in y.
iovar	input variables (iovar[i], i=1,k) and output variable (iovar[k+1]) $(1 \le k \le 1)$
	d), where d is the number of columns in y. Default is $c(1:d)$ .

## Value

cospec	spectrum (complex).
freqr	frequency response function: real part.
freqi	frequency response function: imaginary part.
gain	gain.
phase	phase.
pcoh	partial coherency.
errstat	relative error statistics.
mcoh	multiple coherency.

mulmar 39

mulmar

Multivariate Case of Minimum AIC Method of AR Model Fitting

## **Description**

Fit a multivariate autoregressive model by the minimum AIC procedure. Only the possibilities of zero coefficients at the beginning and end of the model are considered. The least squares estimates of the parameters are obtained by the householder transformation.

## Usage

```
mulmar(y, max.order=NULL, plot=FALSE)
```

## **Arguments**

y a multivariate time series.

max.order upper limit of the order of AR model, less than or equal to n/(2\*d) where n is

the length and d is the dimension of the time series y. Default is  $min(2\sqrt{n}, n/(2*$ 

d)).

plot logical. If TRUE daic[[1]],...,daic[[d]] are plotted.

## **Details**

Multivariate autoregressive model is defined by

$$y(t) = A(1)y(t-1) + A(2)y(t-2) + \ldots + A(p)y(t-p) + u(t),$$

where p is order of the model and u(t) is Gaussian white noise with mean 0 and variance matrix matv. AIC is defined by

$$AIC = n\log(det(v)) + 2k,$$

where n is the number of data, v is the estimate of innovation variance matrix, det is the determinant and k is the number of free parameters.

#### Value

mean mean.

v innovation variance.

aic AIC.

aicmin minimum AIC. daic AIC-aicmin.

order of minimum AIC.

v.maice MAICE innovation variance.

np number of parameters.

40 mulnos

jnd specification of i-th regressor. subregcoef subset regression coefficients. rvar residual variance.

aicf final estimate of AIC (=  $n \log(\text{rvar}) + 2\text{np}$ ).

respns instantaneous response.
matv innovation variance matrix.
morder order of the MAICE model.

arcoef AR coefficients. arcoef[i,j,k] shows the value of i-th row, j-th column, k-th

order.

aicsum the sum of aicf.

mulspe 43

mulspe

Multiple Spectrum

# Description

Compute multiple spectrum estimates using Akaike window or Hanning window.

## Usage

```
mulspe(y, lag=NULL, window="Akaike", plot=TRUE, plot.scale=FALSE)
```

## **Arguments**

y a multivariate time series with d variables and n observations. (y[n,d]) lag maximum lag. Default is  $2\sqrt{n}$ , where n is the number of observations.

window character string giving the definition of smoothing window. Allowed values are

"Akaike" (default) or "Hanning".

plot logical. If TRUE (default) spectrums are plotted as (d, d) matrix.

Diagonal parts: Auto spectrums for each series.

Lower triangular parts : Amplitude spectrums. Upper triangular part : Phase spectrums.

plot.scale logical. IF TRUE the common range of the y-axis is used.

## **Details**

Hanning Window: a1(0)=0.5, a1(1)=a1(-1)=0.25, a1(2)=a1(-2)=0Akaike Window: a2(0)=0.625, a2(1)=a2(-1)=0.25, a2(2)=a2(-2)=-0.0625

## Value

spec spectrum smoothing by "window".

44 nonst

Lower triangular parts : Real parts Upper triangular parts : Imaginary parts

stat test statistics.

coh simple coherence by "window".

nonst

Non-stationary Power Spectrum Analysis

## **Description**

Locally fit autoregressive models to non-stationary time series by AIC criterion.

# Usage

```
nonst(y, span, max.order=NULL, plot=TRUE)
```

## **Arguments**

y a univariate time series. span length of the basic local span.

max.order highest order of AR model. Default is  $2\sqrt{n}$ , where n is the length of the time

series y.

plot logical. If TRUE (the default) spectrums are plotted.

## **Details**

The basic AR model is given by

$$y(t) = A(1)y(t-1) + A(2)y(t-2) + \dots + A(p)y(t-p) + u(t),$$

where p is order of the AR model and u(t) is innovation variance. AIC is defined by

$$AIC = n\log(\det(sd)) + 2k,$$

where n is the length of data, sd is the estimates of the innovation variance and k is the number of parameter.

nonstData 45

## Value

ns the number of local spans.

arcoef AR coefficients.
v innovation variance.

aic AIC.

daic21 = AIC2-AIC1.

daic =  $\frac{\text{daic21}}{n}$  (n is the length of the current model). init start point of the data fitted to the current model. end point of the data fitted to the current model.

pspec power spectrum.

## **Examples**

perars

Periodic Autoregression for a Scalar Time Series

# Description

This is the program for the fitting of periodic autoregressive models by the method of least squares realized through householder transformation.

## Usage

```
perars(y, ni, lag=NULL, ksw=0)
```

## **Arguments**

у	a univariate time series.
ni	number of instants in one period.
lag	maximum lag of periods. Default is $2\sqrt{ni}$ .
ksw	integer. 0 denotes constant vector is not included as a regressor and 1 denotes constant vector is included as the first regressor.

perars 49

## **Details**

```
Periodic autoregressive model (i=1,\ldots,nd,j=1,\ldots,ni) is defined by z(i,j)=y(ni(i-1)+j), z(i,j)=c(j)+A(1,j,0)z(i,1)+\ldots+A(j-1,j,0)z(i,j-1)+A(1,j,1)z(i-1,1)+\ldots+A(ni,j,1)z(i-1,ni)+\ldots+u(i,j),
```

where nd is the number of periods, ni is the number of instants in one period and u(i,j) is the Gaussian white noise. When ksw is set to 0, the constant term c(j) is excluded.

The statistics AIC is defined by  $AIC = n \log(det(v)) + 2k$ , where n is the length of data, v is the estimate of the innovation variance matrix and k is the number of parameters. The outputs are the estimates of the regression coefficients and innovation variance of the periodic AR model for each instant.

#### Value

mean mean. var variance. subset specification of i-th regressor (i=1,...,ni). regression coefficients. regcoef residual variances. rvar np number of parameters. AIC. aic innovation variance matrix. arcoef AR coefficient matrices. arcoef[i,,k] shows i-th regressand of k-th period former. const constant vector. morder order of the MAICE model.

Optimal Controller Design and Simulation

# Description

Produce optimal controller gain and simulate the controlled process.

## Usage

```
simcon(span, len, r, arcoef, impulse, v, weight)
```

## **Arguments**

span	span of control performance evaluation.
len	length of experimental observation.
r	dimension of control input, less than or equal to $d$ (dimension of a vector).
arcoef	matrices of autoregressive coefficients. $arcoef[i,j,k]$ shows the value of $i$ -th row, $j$ -th column, $k$ -th order.
impulse	impulse response matrices.
V	covariance matrix of innovation.
weight	weighting matrix of performance.

# **Details**

The basic state space model is obtained from the autoregressive moving average model of a vector process y(t);

$$y(t) - A(1)y(t-1) - \dots - A(p)y(t-p) = u(t) - B(1)u(t-1) - \dots - B(p-1)u(t-p+1),$$

where A(i) (i = 1, ..., p) are the autoregressive coefficients of the ARMA representation of y(t).

thirmo 55

## Value

gain	controller gain.
ave	average value of i-th component of y.
var	variance.
std	standard deviation.
bc	sub matrices $(pd,r)$ of impulse response matrices, where $p$ is the order of the process, $d$ is the dimension of the vector and $r$ is the dimension of the control input.
bd	sub matrices $(pd, d-r)$ of impulse response matrices.

## **Examples**

```
data(bispecData)
z <- thirmo(bispecData, lag=30)
z$tmomnt</pre>
```

unibar

Univariate Bayesian Method of AR Model Fitting

# Description

This program fits an autoregressive model by a Bayesian procedure. The least squares estimates of the parameters are obtained by the householder transformation.

## Usage

```
unibar(y, ar.order=NULL, plot=TRUE)
```

## **Arguments**

y a univariate time series.

ar. order order of the AR model. Default is  $2\sqrt{n}$ , where n is the length of the time series

у.

plot logical. If TRUE (default) daic, pacoef and pspec are plotted.

unibar 57

## **Details**

The AR model is given by

$$y(t) = a(1)y(t-1) + \ldots + a(p)y(t-p) + u(t),$$

where p is AR order and u(t) is Gaussian white noise with mean 0 and variance v(p). The basic statistic AIC is defined by

$$AIC = n \log(det(v)) + 2m$$
,

where n is the length of data, v is the estimate of innovation variance, and m is the order of the model

Bayesian weight of the m-th order model is defined by

$$W(m) = CONST \times C(m)/(m+1),$$

where CONST is the normalizing constant and  $C(m) = \exp(-0.5AIC(m))$ . The equivalent number of free parameter for the Bayesian model is defined by

$$ek = D(1)^2 + \ldots + D(k)^2 + 1,$$

where D(j) is defined by D(j) = W(j) + ... + W(k). m in the definition of AIC is replaced by ek to be define an equivalent AIC for a Bayesian model.

#### Value

mean mean.
var variance.

v innovation variance.

aic AIC.

aicmin minimum AIC.
daic AIC-aicmin.

order.maice order of minimum AIC.

v.maice innovation variance attained at m=order.maice.

pacoef partial autocorrelation coefficients (least squares estimate).

bweight Bayesian Weight.

integra.bweight

integrated Bayesian weights.

v.bay innovation variance of Bayesian model.

aic.bay AIC of Bayesian model.

np equivalent number of parameters.

pacoef.bay partial autocorrelation coefficients of Bayesian model.

arcoef AR coefficients of Bayesian model.

pspec power spectrum.

Univariate Case of Minimum AIC Method of AR Model Fitting

# **Description**

This is the basic program for the fitting of autoregressive models of successively higher by the method of least squares realized through householder transformation.

# Usage

```
unimar(y, max.order=NULL, plot=FALSE)
```

## **Arguments**

y a univariate time series.

max.order upper limit of AR order. Default is  $2\sqrt{n}$ , where n is the length of the time series

y.

plot logical. If TRUE daic is plotted.

#### **Details**

The AR model is given by

$$y(t) = a(1)y(t-1) + \ldots + a(p)y(t-p) + u(t),$$

where p is AR order and u(t) is Gaussian white noise with mean 0 and variance v. AIC is defined by

$$AIC = n \log(det(v)) + 2k,$$

where n is the length of data, v is the estimates of the innovation variance and k is the number of parameter.

wnoise 59

## Value

mean mean. var variance.

v innovation variance.

aic AIC.

 $\begin{array}{ll} \text{aicmin} & \text{minimum AIC.} \\ \\ \text{daic} & \text{AIC-aicmin.} \end{array}$ 

order.maice order of minimum AIC.

v.maice innovation variance attained at order.maice.

arcoef AR coefficients.

wnoise

White Noise Generator

# Description

Generate approximately Gaussian vector white noise.

# Usage

```
wnoise(len, perr, plot=TRUE)
```

## **Arguments**

len length of white noise record.

perr prediction error.

plot logical. If TRUE (default) white noises are plotted.

## Value

wnoise gives white noises.

Exact Maximum Likelihood Method of Scalar ARMA Model Fitting

## **Description**

Produce exact maximum likelihood estimates of the parameters of a scalar ARMA model.

## Usage

```
xsarma(y, arcoefi, macoefi)
```

## **Arguments**

y a univariate time series.

arcoefi initial estimates of AR coefficients.
macoefi initial estimates of MA coefficients.

## **Details**

The ARMA model is given by

$$y(t) - a(1)y(t-1) - \dots - a(p)y(t-p) = u(t) - b(1)u(t-1) - \dots - b(q)u(t-q),$$

where p is AR order, q is MA order and u(t) is a zero mean white noise.

## Value

gradi initial gradient.

1khoodi initial (-2)log likelihood.

arcoef final estimates of AR coefficients.
macoef final estimates of MA coefficients.

grad final gradient.
